NetID: _____

Worksheet 4: Few-Shot Prompting

Say you have a collection of poems. You want to *classify the sentiment of poems into three categories*: **positive**, **negative**, and **neutral**. You have manually labeled a small number of poems already, but you want to use an LLM to help you label the rest.

Write an example template and a prompt template (as f-strings) to accomplish this task. The `example_template` will be used to format examples along with their labels. The `prompt_template` will include `{examples}` that have been formatted using your `example_template`.

Think carefully about how you want to present examples and what kinds of instructions you should include to encourage consistent outputs.

There's no "right" answer to this question, but here's an example of what you might do:

```
example_template = f"
    POEM: {example}
    SENTIMENT: {label}
"
```

```
prompt_template = f"
    Your task is to classify the sentiment of a POEM into one of
    three categories: POSITIVE, NEGATIVE, or NEUTRAL. You will see
    several examples of properly classified poems.
    ***
    EXAMPLES: {examples}
    ***
    Now, classify the following POEM. Limit your response to a
    single word (POSITIVE, NEGATIVE, or NEUTRAL).
    POEM: {poem}
    SENTIMENT:
"
```
